

## CamJam EduKit Worksheet Seven

**Project** Traffic Light Simulator

**Description** In this project, you will program a traffic light simulator using the circuit from CamJam EduKit Worksheet Six.

### Equipment Required

The circuit built in CamJam EduKit Worksheet Six.

fritzing

### Exercise

In this worksheet, you are going to program your Raspberry Pi with EduKit to act like a standard UK Pelican Crossing traffic lights. All UK lights work in the same way so that drivers know what to expect when they approach them.

Using the techniques learnt in the previous worksheets, your aim is to make the kit act like the traffic lights at a Pelican Crossing, reacting to the button press to allow pedestrians to cross. The LEDs will act as signals to the vehicles; the buzzer will act as a signal to the pedestrians.

The standard sequence is as follows:

Action	Signal to Vehicles	Signal to Pedestrians	Timings
	Steady Green	Red Standing Figure	
<b>Pedestrian presses the button</b>	Steady Amber (Cars should stop if they can)	Red Standing Figure	3 seconds
	Steady Red (Cars must stop)	Red Standing Figure	1 second
<b>Pedestrians can start walking</b>	Steady Red	Green Waking Figure and Beeping	4 to 7 seconds
<b>Pedestrians should not start to cross</b>	Steady Red	Flashing Green Figure and no sound	2 seconds
	Flashing Amber (Cars can start to go again if the crossing is clear)	Flashing Green Figure	6 seconds
	Flashing Amber	Red Standing Figure	1 second
	Steady Green (Cars can proceed)	Red Standing Figure	At least 20 seconds

On the last step, the button can be pressed within the 20 seconds, but the lights should not change immediately. After the 20 seconds, the process can start again.

Using knowledge from the previous CamJam Worksheets, the Code Hints, and the outline code, write your traffic light code!

## Code Hints

Here are some reminders of some of the code you will need:

<code>import library</code>	Remember to import required libraries at the start of the code. You will definitely need time and RPi.GPIO.
<code>GPIO.setup(nn,GPIO.IN)</code>	Sets the pin <i>nn</i> to be used for input
<code>time.sleep(x)</code>	Wait for x seconds
<code>GPIO.output(nn,GPIO.HIGH)</code>	Turns on GPIO pin <i>nn</i>
<code>while condition</code> xxxx yyyy	While condition is true (e.g. <i>x</i> <1), run the commands xxxx and yyyy.
<code>if condition:</code> xxxx	If <i>condition</i> is true, run code xxxx, otherwise run code yyyy

```
else:  
    yyyy
```

## Code Outline

There are comments where you need to fill in some code. Create the file in IDLE3 and start with the following code:

```
# CamJam Edukit 1 - Basics  
# Worksheet 7 - Traffic Lights  
  
# Import Libraries  
import os                # Gives Python access to Linux commands  
import time              # Provides time related commands  
import RPi.GPIO as GPIO # Gives access to the GPIO Pins  
  
# Set the GPIO pin naming mode  
GPIO.setmode(GPIO.BCM)  
GPIO.setwarnings(False)  
  
# Set up variables for the LED, Buzzer and switch pins  
  
# Set up each of the input (switch) and output (LEDs, Buzzer) pins  
  
# Define a function for the initial state (Green LED on, rest off)  
# (If you have the second 'pedestrian LEDs, turn the red on & green  
# off)  
def StartGreen():  
    # Remember all code in the function is indented  
  
# Turn the green off and the amber on for 3 seconds  
# ('Pedestrian' red LED stays lit)  
def SteadyAmber():  
    # Remember all code in the function is indented  
  
# Turn the amber off, and then the red on for 1 second  
def SteadyRed():  
    # Remember all code in the function is indented  
  
# Sound the buzzer for 4 seconds  
# (If you have the 'pedestrian' LEDs, turn the red off and green on)  
def StartWalking():  
    # Make the buzzer buzz on and off, half a second of  
    # sound followed by half a second of silence  
  
# Turn the buzzer off and wait for 2 seconds  
# (If you have a second green 'pedestrian' LED, make it flash on and  
# off for the two seconds)
```

```
def DontWalk():
    # Remember all code in the function is indented

# Flash the amber on and off for 6 seconds
# (And the green 'pedestrian' LED too)
def FlashingAmberGreen():
    # Remember all code in the function is indented

# Flash the amber for one more second
# (Turn the green 'pedestrian' LED off and the red on)
def FlashingAmber():
    # Remember all code in the function is indented

# Go through the traffic light sequence by calling each function
# one after the other.
def TrafficLightSequence():
    # Remember all code in the function is indented

os.system('clear') # Clears the terminal window
print("Traffic Lights")
# Initialise the traffic lights
StartGreen()

# Here is the loop that waits at least 20 seconds before
# stopping the cars if the button has been pressed
while True: # Loop around forever
    ButtonNotPressed = True # Button has not been pressed
    start = time.time() # Records the current time
    while ButtonNotPressed: # While the button has not been pressed
        time.sleep(0.1) # Wait for 0.1s
        if GPIO.input(PinButton) == False: # If the button is pressed
            now = time.time()
            ButtonNotPressed = False # Button has been pressed
            if (now - start) <= 20: # If under 20 seconds
                time.sleep(20 - (now - start)) # Wait until 20s is up
            TrafficLightSequence() # Run the traffic light sequence

GPIO.cleanup()
```

## **Running the Code**

Run your code from the menu or by pressing F5. If errors are reported, check your code again.

Press the button while the green LED is lit and see what happens.

## **Challenge**

Use a second CamJam EduKit, or buy additional green and red LEDs and 330Ω resistors and use them as the Red and Green pedestrian figures.
